BUSINESS CHALLENGE
Each of Paladin's officers are issued assets at the outset of each shift. Manual tracking led to equipment repeated loss; often days or weeks passed before Paladin became aware of the problem.

SOLUTION
MobileAsset makes it easy for Paladin to check assets in and out for each shift. The company can instantly determine if equipment is missing and has established a faster, more effective process for dispatching officers during emergencies – all with MobileAsset.

BENEFITS
$36,000 saved annually
0 equipment loss
3 hours saved EVERY DAY

Rapid growth makes assets disappear
Based in Sacramento, California, Paladin Private Security offers professional patrol services to businesses and residential areas. Paladin operates much like a police force, providing protection, surveillance, and security responses to break-ins and other criminal activity. The company puts more than 55 patrol cars on the street and operates around the clock.

Paladin has experienced rapid growth, doubling its size in each of the last five years. On each shift, security force employees check out a kit of assets. This includes a marked security car, a laptop computer, a Taser stun gun, a video camera, and keys to properties in their patrol area.

The company tightly screens its 135 employees before hiring them. Nevertheless, because officers spend time patrolling public areas, equipment is at risk of theft. Paladin began to see minor theft of assets, as well as inadvertent losses, as the company grew. Losses included several laptops valued at over $2,000 each, a Taser weapon, and fuel cards used for filling patrol cars with gas. The lack of a reliable tracking system resulted in countless hours of investigative expense to resolve each of these issues.

“Once we knew an asset was missing, we spent even more time trying to figure out who had it last,” Carroll said. “We wasted hours literally chasing our tails looking for missing items. In today's environment, we could hardly afford to lose high-dollar items such as laptops anymore.”

Tagging items at home base
Carroll knew the company needed a better way to track its assets. He began searching online for a barcode-based solution.

“At the outset, I found a lot of large vendors that sold to major retailers,” Carroll said. “These companies wanted $15,000 or more, which was too high a price for our company. We wanted a solution to help us but couldn’t afford the expense or complexity of some of the systems available.”

After visiting a local technology retail store and the talking with the customer service team of Wasp Barcode Technologies, Carroll settled on Wasp MobileAsset. This tracking software enables companies to automate processes that, until now, have been undertaken manually – or not at all. MobileAsset provides unprecedented capabilities for capturing, managing, viewing, reporting, and tracking company assets in small businesses, as well as departments of larger companies.

“I love this system. It’s accurate, dependable, and foolproof. I’m so pleased with the results, I’ve even called some of the other security companies in our area to recommend they buy MobileAsset for themselves.

- Matt Carrol, Vice President & Co-founder, Paladin Private Security

Arrested: MobileAsset Shelves Equipment Loss

Interestingly, the system has actually improved staff morale. They now know it as well. Saving the potential loss of just one computer per year, which can instead be spent on higher-value tasks. By heading off this wasted and unproductive time spent searching for assets each day, Carroll estimates a savings of more than $36,000 in time per year, which can instead be spent on higher-value tasks.

“Now, we won’t be losing expensive assets like computers and Tasers,” Carroll added. “We know who checked them out and when, plus our employees know it as well. Saving the potential loss of just one computer has justified the investment.”

At the end of the shift, assets are returned and checked in with a quick barcode scan. This creates an immediate record of what was returned, as well as any missing items.

**Locking up thousands in savings**

With Wasp MobileAsset, Paladin is saving time, saving money, improving customer service, and increasing workforce morale.

“Now, we are saving up to three-hours a day, since we know exactly who possesses each of our assets,” Carroll said. For example, we use to spend time looking in the parking lot for a specific patrol car, when it was actually in the shop for repairs or already assigned and out on patrol.”

By heading off this wasted and unproductive time spent searching for assets each day, Carroll estimates a savings of more than $36,000 in time per year, which can instead be spent on higher-value tasks.

“Now, we won’t be losing expensive assets like computers and Tasers,” Carroll added. “We know who checked them out and when, plus our employees know it as well. Saving the potential loss of just one computer has justified the investment.”

Interestingly, the system has actually improved staff morale. They now have confidence that they are issued the right assets, have the correct keys, and now know the car they are assigned is really in the lot and not “missing” in the repair shop. Plus, everyone is functioning with the same information, Carroll said.

**Securing customers**

By placing barcodes on keys, Paladin also has improved its service for customers. Access keys for a particular property are issued to the patrolman covering that beat, and backup keys are given to officers on teams located nearby.

In the past, officers were reassigned to different beats but might still carry backup keys from their prior locations. In the case of an emergency, it was difficult to find which officers were carrying particular backup keys. What’s more, if backup officers had to be sent without keys, they put themselves in danger by jumping fences and taking other measures to access the property quickly.

Using MobileAsset, Paladin set up a numbering system for access keys. This makes it easier to turn in, reassign, and check out access keys to the primary patrolman, as well as backup officers. Further, by having barcodes on the keys rather than actual addresses, the access cards carry a higher level of security as well.

MobileAsset - Asset Tracking Solution with WPA1200If an alarm is tripped or Paladin receives a call for help, MobileAsset is accessed to immediately reveal which officers are carrying backup keys to the property in question. These officers are contacted and sent to the emergency location much faster than was previously possible. In addition, backup officers no longer place themselves at risk of physical injury from breaking into a locked property. In the future, Carroll plans to leverage MobileAsset to track maintenance on patrol cars. This way, he can ensure the entire fleet is well-maintained, without paying for unneeded services.

“I love this system,” Carroll said. “It’s accurate, dependable, and foolproof. I’m so pleased with the results, I’ve even called some of the other security companies in our area to recommend they buy MobileAsset for themselves.”

---

MobileAsset costs about the same as the lost laptop we had to replace. If the solution could head off just one similar loss, I knew it would more than pay for itself in no time. Convincing my partners was a no brainer, given the affordability and quick payback of purchasing MobileAsset.

- Matt Carroll, Vice President & Co-founder, Paladin Private Security
